

**Your cat is scheduled for general anesthesia/ or sedation today. We recommend a pre-anesthetic blood profile regardless of age to ensure your cat is healthy enough to undergo this procedure.** We process all blood samples in-hospital and will have results in under 10 minutes. These tests resemble those that your own doctor would require before you underwent an anesthetic procedure. In addition, these test results will serve as reference values should your cat become ill in the future.

**Comprehensive Profile & CBC | \$85.00**

A Comprehensive Profile is recommended for all cats that have not had blood work done in the last year or cats that are ill. This profile is **REQUIRED** for all cats that are **7 years of age or older** within at least two months of an anesthetic procedure.

**FelV/FIV Combo Test | \$47.00**

This test is recommended for all cats that have not been tested previously, especially kittens and previously stray cats. Both FelV and FIV are highly communicable diseases that decrease a cat’s ability to fight infections and illness.

**Comprehensive Profile & CBC, with FelV/FIV | \$112.00**

**Thyroid/ Cholesterol Panel | \$55.00, or \$35.00 w/ Comp. Panel**

This test may be recommended for your cat dependant on other health concerns. We will notify you if the doctor recommends this test.

If your cat has had blood work done with normal results within the last two months, the blood work for this procedure may be waived. If your cat is 6 years of age or under, it may also be waived. By declining preanesthetic blood work for your cat you understand and assume all risks involved related to not running the recommended blood work before an anesthetic procedure.

**I am declining the recommended blood work for my cat, regardless of risk.**

**I have authorized blood work above.**
