

Your dog is scheduled for general anesthesia/ or sedation today. We recommend a pre-anesthetic blood profile regardless of age to ensure your dog is healthy enough to undergo this procedure. We process all blood samples in-hospital and will have results in under 10 minutes. These tests resemble those that your own doctor would require before you underwent an anesthetic procedure. In addition, these test results will serve as reference values should your dog become ill in the future.

Blood Parasite Screen | **\$48.00, or \$28.00 w/ a Comp. panel**

This test is **REQUIRED** for all dogs not current on heartworm prevention before undergoing anesthesia or sedation. (It includes heartworm, Lyme disease, Ehrlichia canis, & Anaplasmosis.)

Comprehensive Profile & CBC | **\$92.50**

A Comprehensive Profile is recommended for all dogs that have not had blood work done in the last year or dogs that are ill. This profile is **REQUIRED for all dogs that are 6 years of age or older** within at least two months of an anesthetic procedure.

Thyroid/ Cholesterol Panel | **\$57.90, or \$37.90 w/ any profile**

This test may be recommended for your dog dependant on other health concerns. We will notify you if the doctor recommends this test.

If your dog has had blood work done with normal results within the last two months, the blood work for this procedure may be waived. If your dog is 5 years of age or under, it may also be waived. **By declining preanesthetic blood work for your dog you understand and assume all risks involved related to not running the recommended blood work before an anesthetic procedure.**

I am declining the recommended blood work for my dog, regardless of risk.

I have authorized blood work above.
